CrossCorrelationBasics_AnOverview_forStudents-AfterCompletingRunning

July 16, 2020

1 Do Cross-Correlations with Ambient Noise

- 1.1 General Overview & Pre-Processing Options of Ambient Noise Tomography
- 1.1.1 Goal: Retrieve the Estimated Green's Functions
- 1.2 Adapted From Last Week:
- 1.2.1 Let's do some ambient noise stuff (could be earthquake source problems, receiver functions)

The basic idea of Ambient Noise Tomography (ANT) is that by computing the cross-correlation of the records at two stations (given some important requirements that will not be discussed here)you obtain a waveform this is proportional to the Green's function between the two stations.

In the frequency domain, the cross-spectrum

$$S_{xy} = \hat{X}^*(f) * \hat{Y}(f) \tag{1}$$

where the X^* represents the complex-conjugate of X.

Note that unlike the power spectra

$$S_{xx} = \hat{X}^*(f) * \hat{X}(f) \tag{2}$$

the cross-spectrum is complex-valued. If you take the iFFT of the cross-spectrum, it is equivalent to the cross-correlation between two signals in the time domain.

The codes below try to show you how the correlation function can be obtained using the FFT. As you will see, some sort of normalization is needed.

```

2 Temporal Normalization Options

Note that there are **many** ways to apply temporal normalization to you data, and sometimes it is not needed!

Please discuss in the Slack Unit4 section if you use temporal normalization, which techniques you find works best, and why or why not!

2.1 Option 1: remove spikes, or associations with Earthquakes

There are multiple ways to do this, so please discuss in the slack (discard window, zero & taper around detected signal, etc)!

For example: Remove all signals if > threshold, remove length of time around detected signal > threshold, etc

2.2 Option 2: 1-Bit Normalization (what it sounds like)

2.3 Option 3: Running mean - multiple ways to do this

- 1. Bandpass to 15-50s (band containing energetic surface wave signals from earthquakes [Lin et al., 2007])
- 2. Mean of absolute value from seismogram computed in 128s window centered on this point [Lin et al., 2007]

Have a different preference? Share in the Slack!

```
# we will skip this due to time

# Loop through the windows & apply 1-bit normalization before
cross-correlating, stack result for comparison

#Loop over 1 hour segments, correlate, and stack
corrlen=100 #total delay for the correlation
nminutes=60 #number of minutes in cross-correlation
winlen=int(nminutes*60/dt4) #convert from minutes to nsamples

hourinds=np.arange(0,len(src),winlen)
outsamples=int(corrlen/dt4)

Thoughts on temporal normalization? Please add to the Discussion in the Slack for this Channel!

3 Spectral Whitening

This was discussed in the previous homework from last week from Prof German Prieto, and included again below.

Again, please discuss in the Slack if you have used any of these techniques, and which you have found to be useful (how/why?) – and which you have not (how/why?)!

As you will see, some sort of normalization [in the frequency domain] is needed. For example,

Bensen et al. (200?) suggest to prewhiten the signals before correlation, that is

$$X_{norm}(f) = \frac{\hat{X}(f)}{\langle S_{xx}(f) \rangle} \tag{3}$$

where the $<\cdot>$ represents some sort of averaged, or smoothed version of the term inside. Similar for Y, and then calculate the cross spectrum.

This is equivalent to what is known as the coherency:

$$C_{xy}(f) = \frac{S_{xy}(f)}{\sqrt{\langle S_{xx}(f) \rangle \langle S_{yy}(f) \rangle}}$$
(4)

3.0.1 Compute the normalized correlation instead (coherency)

To get a better behaved, broad band GF, we normalize the the PSD of both signals. In principle, similar to Bensen et al.

```
[19]: # Spectral Whitening: Coherency
      #Loop over 1 hour segments, correlate, and stack
      corrlen=100 #total delay for the correlation
      nminutes=60 #number of minutes in cross-correlation

From Prof German Prieto's notes from last week.

Note that all of these methods have been included below, but please pick one and compare! Together we will try Method 3

3.0.2 Deconvolution interferometry

Because there was a questions about this, let's add a water-level, to stabilize the deconvolution.

We will try the three ways of deconvolution netod here (there are many opther methods. I personally prefer the multitaper method, but that is me.

• Method 1

$$T_{xy}(f) = \frac{X(f)}{Y(f)} \tag{5}$$

• Method 2

$$T_{xy}(f) = \frac{X^*(f)Y(f)}{Y(f)Y^*(f)} = \frac{S_{xy}(f)}{\langle S_{yy}(f) \rangle}$$
(6)

• Method 3

$$T_{xy}(f) = \frac{S_{xy}(f)}{\langle S_{yy} \rangle (f) + W_L} \tag{7}$$

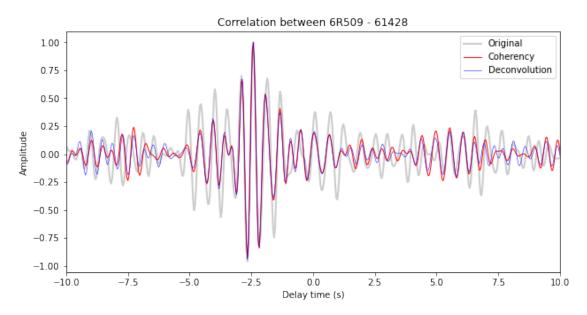

```
